What went well	What didn't go well	What could be done to improve	What questions remain unclear
Everyone had a clear understanding of when deliverables were due, and what needed to be completed by when	No formal form of testing was completed, and was not demonstratable to the mentors	Documentation of how code testing is conducted, and the results of said testing should be recorded as record	Will our original plans for the 'Stars' epic still be achievable with the required change in the API?
Code reviews were conducted well and pair programmers were able to understand each other's code. This helped with dependent features.	There was no clear documentation as comments in the code	There could be clear documentation for the code as comments and function headers. Perhaps a diagram showing component hierarchy	What level of testing is 'sufficient'?
Greater familiarity with using the Vue framework and component creation allowed for a smooth integration of all the features	Understanding of API was not clear before sprint goals were finalised. Freely available APIs could not handle some of the required functionality.	Greater focus on items outside the code is required to provide a more whole complete sprint rather than just working code	
Vue stylising guides were adhered to, which resulted in modular code, that was modular, and easily refactorable	Differences in how previous versions of the framework handled compared to the current version resulted in delays in development	Providing a 'buffer' time in the time estimations will result in a feeling of 'time gained back' if completed early. This may fall victim to the idea that 'each task takes as long as you give it'	
Team regularly communicated and touched base throughout the sprint	Poor estimation of the time it would take to complete some tasks resulted in more work being required	More indepth exploration and explanation of user stories can result in a moer cohesive understanding of features group wide	
Regular meetings resulted in a idenfitied team goal, with shared ideas on how to best achieve the goal	Acceptance criteria definitions were not specific enough in certain cases to be tested in a quantitative fashion.
